   Alignment Scores:
  Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, Activin/inhibin activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and assays for receptor activity, arthritis and inflammation, leukaemias and
   The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system diseases, such as
  specification.

CC full length cDNAs defined in the specification. Where a primer set to the complementary strand of a polynucleotide which complementary trand of a polynucleotide which complementary the sequences defined in the specification, where the coligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprises at least 15 nucleotides; or (b) a combination complementary strand of a polynucleotide which comprises a 5'-end complementary to the complementary strand of a polynucleotide which comprises a 5'-end complementary to a polynucleotide which comprises a 5'-end sequence complementary to a constitue of the solution  The primers are 15 nucleotides and the combination of the specification. The primers sets can be used in antisense therapy and constitue the specification of the solution and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers are also useful for the converse easily without any specialised methods. AAH03166 to AAH13628 and CC AAB95893 represent human amino acid sequences; AAB92446 to AAH13633 to AAH18742 represent human cDNA sequences; AAB92446 to

  The patent discloses human uridine kinase-like polypeptides, designated CC 57658 and polynucleotides encoding such proteins. 57658 DNAs and proteins CC are useful for developing diagnostic and therapeutic agents for 57658—CC mediated or related disorders such as haematopoietic neoplastic disorders (e.g. leukaemia), haematopoietic disorders (e.g. psoriasis, dermatitis, C diabetes mellitus, rheumatoid arthritis, disorders of bone (e.g. rickets, CC diabetes mellitus, rheumatoid arthritis, disorders of bone (e.g. rickets, CC disorders), heart (e.g. sarcoma, myocardial infarction), blood vessels (e.g. hypertension, atherosclerosis) and neurons (e.g. Huntington's CC disease, Alzheimer's disease, Parkinson's disease). 57658 sequences or their antibodies are useful in screening assays, detection assays (e.g. forensic biology) and predictive medicine (e.g. diagnostic assays, corresponders. 57658 DNAs are useful in gene therapy, in chromosome mapping, to identify an individual from a minute biological sample (tissue typing) and to aid in forensic identification of the biological sample. The
  New isolated human uridine kinase family polypeptide 57658, useful for treating hematopoietic neoplastic disorders and disorders of neurons, heart and blood vessels -
  WPI; 2002-140091/18.

Novel nucleic acids and polypeptides, useful for treating disorders

N-PSDB; AAI60444

as

central nervous system injuries

```
Query Match:
DB:
  US-09-896-522-3 (1-834) x AAM41288
  Percent Similarity:
   The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system diseases, such as alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, Activinjinhibin activity, chemocractic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and
  C.N.S disorders.

The invention relates to newly identified human uridine kinase (UDK) CC polypeptides and polynucleotides and methods for producing such CC polypeptides by recombinant techniques. Also disclosed in the invention CC are methods for utilising uridine kinase polypeptides and polynucleotides in diagnostic assays. The polynucleotides and polypeptides of the CC invention may be used as diagnostic reagents by detecting mutations in an CC associated gene. An array of Oligonucleotide probes comprising the CC uridine kinase polynucleotide sequence or fragments thereof can be CC constructed to conduct efficient screening of genetic mutations, for CC example. Detection of abnormally decreased or increased levels of CC polypeptide or mRNA expression may also be used for diagnosing or CC may be used to disease of the invention studies and tissue expression studies. The polypeptides of the invention or fragments thereof may be used as immunogens to produce CC increasing the polypeptide. The polypeptides of the invention can be used for chromosome CC construction or fragments thereof may be used as immunogens to produce contibodies. These antibodies may be employed to isolate or identify CC clones expressing the polypeptide. The polypeptides and polymucleotides of the invention can be used as a vaccine or in gene therapy to treat continuous such as human ovarian cancer, human colon carcinomas, and

   The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polypucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system disease, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, Activiny inhibin activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and

   The patent discloses human uridine kinase-like polypeptides, designated 57658 and polynucleotides encoding such proteins. 57658 DNAs and proteins care useful for developing diagnostic and therapeutic agents for 57658-mediated or related disorders such as haematopoietic neoplastic disorders (e.g. leukaemia), haematopoietic disorders (e.g. psoriasis, dermatitis, diabetes mellitus, rheumatoid arthritis, disorders of bone (e.g. rickets, osteoporosis), heart (e.g. sarcoma, myocardial infarction), blood vessels (e.g. hypertension, atherosclerosis) and neurons (e.g. Huntington's disease, Alzheimer's disease, Parkinson's disease). 57658 sequences or their antibodies are useful in screening assays, detection assays (e.g. forensic biology) and predictive medicine (e.g. diagnostic assays, prognostic assays, and monitoring clinical trials and pharmacogenomics). They are useful as reagents for diagnosing and treating 57658-mediated disorders. 57658 DNAs are useful in gene therapy, in chromosome mapping, to identify an individual from a minute biological sample (tissue typing) and to aid in forensic identification of the biological sample. The

  The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotus for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins
   The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from at ftp.wipo.int/pub/published_pct_sequences.
  New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell interactions - \,

  Submitted (FEB-2002) to the EMBL/GenBank/DDBU databases.
-I- FUNCTION: Phosphorylates uridine and cytidine to uridine monophosphate and cytidine monophosphate. Does not phosphorylate
  SEQUENCE
   mRNA.";
  No.:
  TIGRFAM8;
  deoxyribonucleosides or purine ribonucleosides. Can use ATP or GTP as a phosphate donor. Can also phosphorylate cytidine and uridine nucleoside analogs such as 6-azauridine, 5-fluorouridine, 4-thiouridine, 5-bromouridine, N(4)-acetylcytidine, N(4)-benzoylcytidine, 5-fluorocytidine, 2-thiocytidine, 5-benzoylcytidine, and N(4)-anisoylcytidine, 5-methylcytidine, and N(4)-anisoylcytidine, 5-cathlyTIC ACTIVITY: ATP + uridine = ADP + UMP CATALYTIC ACTIVITY: ATP + cytidine = ADP + CMP.
CATALYTIC ACTIVITY: ATP + cytidine = ADP + CMP.
CATALYTIC ACTIVITY: Diquitous.
TISSUE SPECIFICITY: Ubiquitous.
SIMILARITY: BELONGS TO THE URIDINE KINASE FAMILY.

   The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system disease, such as alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activity incompactic/chemokinetic activity, hemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and

DB:
  The present invention describes primer sets for synthesising 5602 CC full-length cDNAs defined in the specification. Where a primer set CC comprises: (a) an oligo-dT primer and an oligonucleotide comprises one of the 5602 nucleotide sequences defined in the specification, where the CC oligonucleotide comprises at least 15 nucleotides; or (b) a combination CC of an oligonucleotide comprising a sequence complementary to the CC complementary strand of a polynucleotide which comprises a 5'-end CC sequence and an oligonucleotide comprising a sequence, where the CC oligonucleotide which comprises a 3'-end sequence, where the CC oligonucleotide comprises a 3'-end sequence, where the CC oligonucleotide comprises a 3'-end sequence, where the combination of the 5'-end sequence/3'-end sequence is selected from those defined in CC the specification. The primers sets can be used in antisense therapy and CC in gene therapy. The primers are useful for synthesising polynucleotides, ce particularly full-length cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by CC the full-length cDNAs. The primers are also useful for the CC AAB95893 represent human amino acid sequences; and AAH13629 to AAH13632 represent oligonucleotides, all of which are used in the exemplification of the present invention.

  The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system disease, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, Activiny, inhibin activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and

Novel human uridine kinase polypeptides useful for treating cancers, and to identify agonists and antagonists of the polypeptide useful for treating conditions associated with uridine kinase imbalance

Claim 3; Page 29-30; 31pp; English.

The invention relates to newly identified human uridine kinase (UDK) CC polypeptides and polynucleotides and methods for producing such CC polypeptides by recombinant techniques. Also disclosed in the invention CC are methods for utilising uridine kinase polypeptides and polynucleotides c1 in diagnostic assays. The polynucleotides and polypeptides of the CC invention may be used as diagnostic reagents by detecting mutations in an CC associated gene. An array of oligonucleotide probes comprising the CC uridine kinase polynucleotide sequence or fragments thereof can be CC constructed to conduct efficient screening of genetic mutations, for CC example. Detection of abnormally decreased or increased levels of CC polypeptide or mRNA expression may also be used for diagnosing or CC determining susceptibility of a subject to a disease of the invention. CC The polynucleotide sequences of the invention can be used for chromosome CC localisation studies and tissue expression studies. The polypeptides of the invention or fragments thereof may be used as immunogens to produce CC antibodies. These antibodies may be used as immunogens to produce antibodies. These polypeptides may be used to isolate or identify CC clones expressing the polypeptide. The polypeptides and polynucleotides of the invention can be used as a vaccine or in gene therapy to treat CC diseases such as human ovarian cancer, human coton carcinomas, and CC uridine kinase of the invention.

CC uridine kinase of the invention.

CC polypeptides by recombinant techniques. Also disclosed in the invention of are methods for utilising uridine kinase polypeptides and polynucleotides and polypeptides of the invention of are methods for utilising uridine kinase polypeptides and polynucleotides in diagnostic assays. The polynucleotides and polypeptides of the convention may be used as diagnostic reagents by detecting mutations in an associated gene. An array of oligonucleotide probes comprising the curidine kinase polynucleotide sequence or fragments thereof can be constructed to conduct efficient screening of genetic mutations, for constructed to conduct efficient screening of genetic mutations, for constructed to abnormally decreased or increased levels of collectermining susceptibility of a subject to a disease of the invention. The polynucleotide sequences of the invention can be used for chromosome control of the invention or fragments thereof may be used as immunogens to produce the invention or fragments thereof may be used as immunogens to produce contibodies. These antibodies may be employed to isolate or identify colones expressing the polypeptide. The polypeptides of the invention can be used as a vaccine or in gene therapy to treat continuanclogical disorders. This sequence represents the protein relating to a human uridine kinase (URX) of the invention.

CC NOTE: The present sequence is stated as being the same as that shown as CSEQ ID NO: 2 in the sequence listing of the specification. However, the
   Novel human uridine kinase polypeptides useful for treating cancers, and to identify agonists and antagonists of the polypeptide useful for treating conditions associated with uridine kinase imbalance -
   The invention relates to newly identified human uridine kinase (UDK)

    Local Similarity:
   agonist or antagonist, or genetic construct encoding an HTPS protein are useful for treating a disease or condition associated with decreased or increased expression of functional HTPS. Disorders which may be treated using such compositions include cell proliferative disorders and immune disorders. For example, diseases which may be treated include atherosclerosis, hepatitis, psoriasis, cancers (including breast, bladder, bone marrow, brain and uterus cancer), inflammation, AIDS, Addison's disease, allergies, asthma, anaemia, cirrhosis, Crohn's disease, atopic dermatitis, diabetes mellitus, multiple sclerosis, rheumacoid arthritis, pancreatitis, systemic lupus erythematosus, thrombocytopenia, and ulcerative colitis. They may also be used to treat complications of cancer, haemodialysis, extracorporeal circulation, trauma and haematopoietic cancer, including lymphoma, leukaemia and haematopoietic cancer, including lymphoma lymphom
   Sequences AAB73494-AAB73535 represent novel human transferase proteins HTFS-1 to HTFS-42, and sequences AAB23801-AAB23842 represent cDNAs encoding them. The proteins play important roles in the regulation of cellular signalling and proliferation. The HTFS proteins are useful for screening compounds for their effectiveness as agonists or antagonists of transferase activity, or for compounds that specifically bind to an HTFS protein or which modulates the activity of an HTFS protein. Pharmaceutical compositions comprising an HTFS protein, HTFS protein.
  Human transferase; HTFS; agonist; antagonist; cellular signalling; proliferation; cell proliferative disorder; immune disorder; atherosclerosis; hapatitis; psoriasis; cancer; tumour; inflammation; AIDS; Addison's disease; allergy; asthma; anaemia; cirrhosis; Crohn's disease; atopic dermatitis; diabetes mellitus; multiple sclerosis; rheumatoid arthritis; pancreatitis; systemic lugus erythematosus; thrombocytopenia; ulcerative colitis; haemodialysis; extracorporeal circulation; trauma; transgenic animal;
   myeloma. Polynucleotides encoding HTFS proteins are useful for creating transgenic animals to model human diseases, for diagnostic purposes and to generate hybridisation probes useful in mapping the naturally occurring genomic sequences. HTFS, and its catalytic or immunogenic fragments are useful for screening libraries of compounds in a variety of drug screening techniques. Antibodies which specifically bind HTFS may kneed for the diagnosis of disorders associated with the expression of
  Human transferase polypeptides and polynucleotides useful for diagnosis, prevention and treatment of cell proliferative and system disorders and for identifying agonists and antagonists
  HTFS, or in assays to monitor patients being treated with agonists, antagonists or inhibitors of HTFS. The present s

   cardioactive, immunomodulatory, muscular, vulnerary, gastrointestinal, nephrotropic, antiinfective, gynaecological and antibacterial activities, and can be used in gene therapy. The prostate cancer antigen polynucleotides may be used for detection of prostate cancer, chromosome identification, as chromosome markers, and for numerous other diagnostic or research purposes. The prostate cancer antigens may be used to treat disorders such as neural, immune, muscular, reproductive, gastrointestinal, pulmonary, cardiovascular, renal, and proliferative disorders, wounds, and infectious diseases. AAF16506 to AAF16514 to AAB57333 represent sequences used in the exemplification of the present
   neuroprotective; cytostatic; cardioactive; immunomodulatory; muscular; vulnerary; gastrointestinal; nephrotropic; antiinfective; gynaecological; antibacterial; gene therapy; neural; immune; reproductive; renal; gastrointestinal; pulmonary; cardiovascular; proliferative disorder; wound; infectious disease.
   AAF15566 to AAF16505 encode the human prostate cancer associated proteins, called prostate cancer antigens, given in AAB56363 to AAB57302. The prostate cancer antigens can have neuroprotective, cytostatic,

   the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system disease, such as alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, Activin/inhibin activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and

  capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryoses for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176-ABL30511), appressed DNA sequences (ABL16176) and the encoded proteins
               ABG27216
   The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from at ftp.wipo.int/pub/published_pct_sequences.

  cc polypeptide (II) sequences. (I) is useful as hybridisation probes, cc polymerase chain reaction (PCR) primers, oligomers, and for chromosome cc and gene mapping, and in recombinant production of (II). The cc polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques cc to restore normal activity of (II) or to treat disease states involving cc (II). (II) is useful for generating antibodies against it, detecting or cr quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical ci maging of sites expressing (II). (II) and (II) are useful for treating cc disorders involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in cc diagnostics, forensics, gene mapping, identification of mutations cc responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and cannot acid sequences. ABG00010-ABG30377 represent novel human cc diagnostic amino acid sequences of the invention.

Cc specification, but was obtained in electronic format directly from WIPO as fire wino in the printed content of the invention.
   New isolated polynucleotide and encoded polypeptides, useful diagnostics, forensics, gene mapping, identification of mutat responsible for genetic disorders or other traits and to assebiodiversity -

  OM protein - protein search, using sw model
  95
  Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

| ENCE FROM N.A.  Y.R., Yu L., Zhao S.Y.;  Y.R., Yu L., Zhao S.Y.;  Ining of a new human cDNA similar to Mus musculus u:  ming of a new human cDNA similar to Mus musculus u:  ming of a new human cDNA similar to Mus musculus u:  itted (FEB-2002) to the EMBL/GenBank/DDBJ database;  FUNCTION: Phosphorylates uridine and cytidine to u:  monophosphate and cytidine monophosphate. Does not  deoxyribonucleosides or purine ribonucleosides. Cal  deoxyribonucleosides or purine ribonucleosides. Cal  as a phosphate donor. Can also phosphorylate cytidi  nucleoside analogs such as 6-azauridine, 5-fluorout  thiouridine, 5-bromouridine, N(4)-acetylcytidine, u  benzoylcytidine, 5-fluorocytidine, 2-thiocytidine, benzoylcytidine, and N(4)-anisoylcytidine, 2-thiocytidine, methylcytidine, and N(4)-anisoylcytidine.  CAPALYTIC ACTIVITY: ATP + uridine = ADP + UMP.  CAPALYTIC ACTIVITY: ATP + cytidine = ADP + CMP.  PATHWAY: Pyrimidine salvage pathway.  TISSUE SPECIFICITY: Ubiquitous.   SEQUENCE OF 18-277 FROM N.A.
  monophosphate and cytidine monophosphate. Does not phosphorylate deoxyribonucleosides or purine ribonucleosides. Can use ATP or GT as a phosphate donor. Can also phosphorylate cytidine and uridine nucleoside analogs such as 6-azauridine, 5-fluorouridine, 4-thiouridine, 5-bromouridine, N(4)-acetylcytidine, N(4)-benzoylcytidine, 5-fluorocytidine, 2-thiocytidine, 5-methylcytidine, and N(4)-anisoylcytidine, 5-methylcytidine, and N(4)-anisoylcytidine, 5-methylcytidine, and N(4)-anisoylcytidine (By similarity). CATALYTIC ACTIVITY: ATP + uridine = ADP + UMP. CATALYTIC ACTIVITY: ATP + cytidine = ADP + CAPP. PATHWAY: Pyrimidine salvage pathway.

SIMILARITY: BELONGS TO THE URIDINE KINASE FAMILY.
   H. Blochem. Biophys. 336:105-112(1996).
FUNCTION: Phosphorylates uridine and cytidine to uridine monophosphate and cytidine monophosphate.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

   The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system disease, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, Activinjoinhibin activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and

   The present invention describes primer sets for synthesising 5602 (C full-length cDNAs defined in the specification. Where a primer set comprises: (a) an oligo-dT primer and an oligonucleotide complementary complementary strand of a polynucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the coligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end complementary to a combination of complementary strand of a polynucleotide which comprises a 5'-end sequence and an oligonucleotide comprising a sequence, where the coligonucleotide comprises at least 15 nucleotides and the combination of the specification. The primers set send sequence, where the combination of the specification. The primers set can be used in antisense therapy and comparison of the specification. The primers are useful for synthesising polynucleotides, particularly full-length cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length cDNAs casily without any specialised methods. AAH33166 to AAH3628 and C C compresent oligonucleotides, all of which are used in the exemplification of the present invention.

   The patent discloses human uridine kinase-like polypeptides, designated CC 57658 and polymucleotides encoding such proteins. 57658 DNAs and proteins CC are useful for developing diagnostic and therapeutic agents for 57658-CC mediated or related disorders such as haematopoietic neoplastic disorders CC (e.g. leukaemia), haematopoietic disorders (e.g. psoriasis, dermatitis, CC diabetes mellitus, rheumatold arthritis, disorders of bone (e.g. rickets, CC clep.), heart (e.g. sarcoma, myocardial infarction), blood vessels (e.g. hypertension, atherosclerosis) and neurons (e.g. Huntington's CC disease, Alzheimer's disease, Parkinson's disease). 57658 sequences or their antibodies are useful in screening assays, detection assays (e.g. CC forensic biology) and predictive medicine (e.g. diagnostic assays, CC Thoy are useful as reagents for diagnosing and treating 57658 mediated CC disorders. 57658 DNAs are useful in gene therapy, in chromosome mapping, colineaters. 57658 DNAs are useful in gene therapy, in chromosome mapping, colineating and treating of the biological sample (tissue typing) and to aid in forensic identification of the biological sample.   The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activity seems such as: Immune system suppression, Activin/inhibin activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and C.    CC The invention relates to newly identified human uridine kinase (UDK)
CC polypeptides and polynucleotides and methods for producing such
CC polypeptides by recombinant techniques. Also disclosed in the invention
CC are methods for utilising uridine kinase polypeptides and polynucleotides
CC in diagnostic assays. The polynucleotides and polypeptides of the
CC invention may be used as diagnostic reagents by detecting mutations in an
CC associated gene. An array of oligonucleotide probes comprising the
CC constructed to conduct efficient screening of genetic mutations, for
CC example. Detection of abnormally decreased or increased levels of
CC determining susceptibility of a subject to a disease of the invention.
CC The polynucleotide sequences of the invention can be used for chromosome
CC localisation studies and tissue expression studies. The polypeptides of
CC the invention or fragments thereof may be used as immunogens to produce
CC antibodies. These antibodies may be used as immunogens to produce
CC clones expressing the polypeptide. The polypeptides and polynucleotides
CC of the invention can be used as a vaccine or in gene therapy to treat
CC diseases such as human ovarian cancer, human colon carcinomas, and
CC uridine kinase of the invention.

  CC The invention relates to novel genes (ABL89449-ABL90853) and proteins (CC (ABB89040-ABB90444) useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are commedical conditions e.g. by protein or gene therapy. The genes are commedical conditions e.g. by protein or gene therapy. The genes are commedicated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant) agonists are useful commedication of the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune disorders e.g. Addison's disease, allergies, autoimmune the modified and the commence of the season with a sequence of the commence of the commence of the commence of the protein and ulcerative colities, (c) cardiovascular disorders such as myocardial schaemias, colities, (c) cardiovascular disorders such as myocardial ischaemias, colities, (c) cardiovascular disorders such as myocardial anoxia and epilepsy, and (f) infectious diseases such as myocardial, fungal candidate for the commence of the fort the content of th

  The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system disease, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, Activinyinhibin activity, chemotentic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and

CC pharmaceutical compositions comprising an HTFS protein, HTFS
agonist or antagonist, or genetic construct encoding an HTFS
protein are useful for treating a disease or condition associated
CC with decreased or increased expression of functional HTFS. Disorders
CC which may be treated using such compositions include cell proliferative
CC disorders and immune disorders. For example, diseases which may be
CC treated include atherosclerosis, hepatitis, psoriasis, cancers (including
CC presst, bladder, bone marrow, brain and uterus cancer), inflammation,
CC AIDS, Addison's disease, altergies, asthma, anaemia, cirrhosis, Crohn's
CC disease, atopic dermatitis, diabetes mellitus, multiple sclerosis,
CC disease, atopic dermatitis, pancreatitis, systemic lupus erythematosus,
CC thrombocytopenia, and ulcerative colitis. They may also be used to treat
CC complications of cancer, haemodialysis, extracorporeal circulation,
CC trauma and haematopoietic cancer, including lymphoma, leukaemia and
CC transgenic animals to model human diseases, for diagnostic purposes and
CC transgenic animals to model human diseases, for diagnostic purposes and
CC cocurring genomic sequences. HTFS, and its catalytic or immunogenic
CC transgenic animals to model human diseases for compounds in a variety of
CC drug screening techniques. Antibodies which specifically bind HTFS may be
used for the diagnosis of disorders associated with the expression of
   atherosclerosis; hepatitis; psoriasis; cancer; tumour; inflammation; AIDS; Addison's disease; allergy; asthma; anaemia; cirrhosis; Crohn's disease; atopic dermatitis; diabetes mellitus; multiple sclerosis; rheumatoid arthritis; pancreatitis; systemic lupus erythematosus; thrombocytopenia; ulcerative colitis; haemodialysis; extracorporeal circulation; trauma; transgenic anima
  Sequences AAB73494-AAB73535 represent novel human transferase proteins HTFS-1 to HTFS-42, and sequences AAH23801-AAH23842 represent cDNAs encoding them. The proteins play important roles in the regulation of cellular signalling and proliferation. The HTFS proteins are useful for screening compounds for their effectiveness as agonists or antagonists cransferase activity, or for compounds that specifically bind to an HTFS protein or which modulates the activity of an HTFS protein.
   Human transferase polypeptides and polynucleotides useful for diagnosis, prevention and treatment of cell proliferative and system disorders and for identifying agonists and antagonists

                      The invention relates to 2175 novel human ovarian antigens (ABP41054-ABP43228) and to cDNAs encoding them (ABC94131-ABC)6305), and also encompasses polypeptides 90% identical and polynucleotides 95% identical to the sequences of the invention. The invention additionally relates to recombinant vectors and host cells comprising human ovarian antigen polynucleotides, antibodies against human ovarian antigens, and the use of ovarian antigen polynucleotides and polypeptides in diagnosing, treating, prognosing or preventing various ovary and/or breast related disorders. Such conditions include ovarian cancer and breast cancer, and
  ovarian cancer; breast cancer; tumour; reproductive system disorder; infertility; pregnancy disorder; anovulation; polycystic ovary syndrome; pCOS; ovarian cyst; dysmenorrhoea; endocrine disorder; infection; inflammatory condition; immune disorder; blood disorder; cardiovascular disorder; respiratory disorder; neurological disorder; gastrointestinal disorder; urinary system disorder; drug screening; gene therapy; chromosome mapping; forensic analysis; antibody preparation; cytostatic; immunomodulatory; neuroprotective;
  Isolated nucleic acid molecules encoding novel ovarian polypeptides, useful in the prevention, treatment and diagnosis of cancer (e.g. ovarian cancer), immune disorders, cardiovascular disorders and neurological diseases

   or research purposes. The prostate cancer antigens may be used to treat disorders such as neural, immune, muscular, reproductive, gastrointestinal, pulmonary, cardiovascular, renal, and proliferative disorders, wounds, and infectious diseases. AAF16506 to AAF16514 to AAB57303 represent sequences used in the exemplification of the present
  proteins, called prostate cancer antigens, given in AAB56363 to AAB57302. The prostate cancer antigens can have neuroprotective, cytostatic, cardioactive, immunomodulatory, muscular, vulnerary, gastrointestinal, nephrotropic, antiinfective, gynacological and antibacterial activities,
   and can be used in gene therapy. The prostate cancer antigen polynucleotides may be used for detection of prostate cancer, chromosome identification, as chromosome markers, and for numerous other diagnostic
   Prostate cancer associated gene sequences, referred to as prostate cancer antigens, useful for treatment, prevention, and diagnosis of disorders such as prostate cancer -

  in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system diseases, such as Alzheiner's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, Activin, habibin activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and

   The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invent useful in developmental biology and in elucidating cell signalling cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins

  polynucleotides are also used in diagnostics as expressed sequence tags (for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations or responsible for genetic disorders or other traits to assess biodiversity and oacid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention.
  The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as mybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The

   The invention relates to newly identified human uridine kinase (UDK)
CC polypeptides and polynucleotides and methods for producing such
CC polypeptides by recombinant techniques. Also disclosed in the invention
CC are methods for utilising uridine kinase polypeptides and polynucleotides
Ci ni diagnostic assays. The polynucleotides and polypeptides of the
CC invention may be used as diagnostic reagents by detecting mutations in an
CC associated gene. An array of oligonucleotide probes comprising the
CC uridine kinase polynucleotide sequence or fragments thereof can be
CC constructed to conduct efficient screening of genetic mutations, for
CC example. Detection of abnormally decreased or increased levels of
CC polypeptide or mRNA expression may also be used for diagnosing or
CC determining susceptibility of a subject to a disease of the invention.
CC The polynucleotide sequences of the invention can be used for chromosome
CC localisation studies and tissue expression studies. The polypeptides of
CC clones expressing the polypeptides may be used as immunogens to produce
CC clones expressing the polypeptide. The polypeptides and polynucleotides
CC clones expressing the polypeptide. The polypeptides of the invention can be used as a vaccine or in gene therapy to treat
CC diseases such as human ovarian cancer, human colon carcinomas, and
CC immunological disorders. This polynucleotide sequence represents the DNA
CC of a human uridine kinase of the invention
  Novel human uridine kinase polypeptides useful for treating cancers, and to identify agonists and antagonists of the polypeptide useful treating conditions associated with uridine kinase imbalance -

  The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Inmune system suppression, Activin/inhibin activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and C.N.S discreters

The patent discloses human uridine kinase-like polypeptides, designated 57658 and polynuclectides encoding such proteins. 57658 DNAs and proteins are useful for developing diagnostic and therapeutic agents for 57658 mediated or related disorders such as haematopoietic neoplastic disorders (e.g. leukaemia), haematopoietic disorders (e.g. psoriasis, dermatitis, diabetes mellitus, rheumatoid arthritis, disorders of bone (e.g. rickets,

   osteoporosis), heart (e.g. sarcoma, myocardial infarction), blood vessel. (e.g. hypertension, atherosclerosis) and neurons (e.g. Huntington's disease, Alzheimen's disease, Parkinson's disease). 57658 sequences or their antibodies are useful in screening assays, detection assays (e.g. forensic biology) and predictive medicine (e.g. diagnostic assays, prognostic assays, and monitoring clinical trials and pharmacogenomics). They are useful as reagents for diagnosing and treating 57658-mediated disorders. 57658 DNAs are useful in gene therapy, in chromosome mapping, to identify an individual from a minute biological sample (tissue typing and to aid in forensic identification of the biological sample. The present sequence is a DNA encoding human 57658 protein.

   The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, Activin/inhibin activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and

Primer sets for synthesizing polynucleotides, particularly the full-length cDNAs defined in the specification, and for the detand/or diagnosis of the abnormality of the proteins encoded by full-length cDNAs detection by the

Claim æ ID 13951; 2537pp + G ROM; English

The present invention describes primer sets for synthesising 5602 cc full-length cDNAs defined in the specification. Where a primer set ccomprises: (a) an oligo-dT primer and an oligonucleotide complementary to the complementary strand of a polynucleotide which comprises one of cc the 5602 nucleotide sequences defined in the specification, where the coligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end cc polynucleotide which comprises a 3'-end sequence complementary to a combination of complementary to a combination of complementary to a combination of complementary to a combination of complementary to a complementary to a complementary to a complementary to a complementary to a complementary to a complementary to a complementary to a complementary to a complementary to a complementary to a complementary to a complementary complementary to a complementary to a complementary to a complementary complementary to a complementary to a complementary complementary to a complementary complementary to a complementary complementary to a complementary complementary complementary complementary complementary complementary complementary complementary complementary complementary complementary complementary complementary complementary complementary complementary complementary complementary complementary complementary complementary complementary complementary complementary complementary complementary complementary complementary complementary complementary complementary complementary complementary complementary complementary complementary complementary complementary complementary complementary complementary complementary complementary complementary complementary complementary complementary complementary complementary complementary complementary complementary complementary complementary complementary complementary complementary complementary complementary complementary complementar

The present invention describes primer sets for synthesising 5602 (C full-length cDNAs defined in the specification. Where a primer set (C comprises: (a) an oligo-dT primer and an oligonucleotide complementary to the complementary strand of a polynucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the coligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprises and an experimentary to a sequence complementary to a combination of a polynucleotide which comprises a 5'-end complementary to a polynucleotide comprises a 3'-end sequence complementary to a polynucleotide comprises a 3'-end sequence, where the coligonucleotide comprises a 3'-end sequence, where the combination of the 5'-end sequence3'-end sequence is selected from those defined in the specification. The primers sets can be used in antisense therapy and in gene therapy. The primers are useful for synthesising polynucleotides, particularly full-length cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length CDNAs easily without any specialised methods. AAH03166 to AAH13628 and C AAH13631 to AAH13674 represent human cold sequences; AAB92446 to C AAB95893 represent human amino acid sequences; and AAH13629 to AAH13632 represent invention.
  full-length cDNAs define and/or diagnosis of the full-length cDNAs -

  CC (ABB89040-ABB90444) useful for preventing, treating or amelicationating commedical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant) agonists are useful con the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and order cancers of the addrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune disorders e.g. Addison's disease, altergies, autoimmune hamble for anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's cisease, multiple sclerosis, rheumatoid arthritis and ulcrative colitis; (c) cardiovascular disorders such as myccardial ischaemias; (d) wound healing; (e) neurological diseases e.g. cerebral anoxia and cepilepsy; and (f) infectious diseases such as myccardial, fungal cand parasitic infections.

  Percent Similarity:
  molecules for disease detection and treatment (MDDT), and the colored polynucleotide sequences (mddt) encoding them. The MDDT polypeptides can be used to screen for molecules that bind to, or are bound by the cell type. Probes comprising at least 20 nucleotides of a tissue or cell type. Probes comprising at least 20 nucleotides of the mddt colynucleotide may be used to assess the toxicity of a test compound. The MDDT polypeptides and mddt polynucleotides are useful in the coling of the molecules and treatment of diseases associated with the expression of molecules for disease detection and treatment. Such colsorders include cell proliferative disorders (e.g. arteriosclerosis, crirhosis, or cancers), and autoimmune/inflammatory disorders (e.g. asthma, Crohn's disease, or multiple sclerosis). The mddt colynucleotides may also be used as molecule markers, in microarrays, and in somatic or germline gene therapy. ABS51779-ABS51814 encode the MDDT proteins of the invention.

CC conditions, such as, Alzheimer's disease, Parkinson's disease, and CC AIDS-related complex; stimulates chondrocyte growth, thus they can be used to enhance bone and periodontal regeneration and aid in tissue transports or bone grafts; prevents skin aging due to sunburn by CC members activate hair-forming cells and promotes melanocyte growth; cells and promotes melanocyte growth; stimulates growth and differentiation of hematopoietic cells and bone CC marrow cells when used in combination with other cytokines; maintains CC organs before transplantation or for supporting cell culture of primary CC tissues; induces tissue of mesodermal origin to differentiate in early CC embryos; increases or decreases the differentiation or proliferation of cembryonic stem cells, besides, haematopoietic lineage, modulates CC mammalian characteristics, such as, body height, weight, hair colour, eye colour, skin, percentage of adipose tissue, pigmentation, size, and shape (e.g., cosmetic surgery); modulates mammalian metabolism; changes CC mammal's metal state or physical state by influencing biorhythms,
  caricadic rhythms, depression, tendency for violence, tolerance for pai reproductive capabilities, hormonal or endocrine levels, appetite, libido, memory, or stress; increases or decreases storage capabilities, fat content, lipid, protein, carbohydrate, vitamins, minerals, cofactor or other nutritional components. This sequence encodes a novel human
   burns, post-operative tibbue types, and limb regeneration; stimulates neuronal growth; can treat and preneuronal damage occurring in certain disorders or neurodegenerative conditions, such as, Alzheimer's disease, Parkinson's disease, and conditions, such as, Alzheimer's disease, Parkinson's thus they can l
   The invention describes an isolated nucleic acid molecule comprising a sequence encoding musculoskeletal system associated polypeptides useful for detecting disorders, e.g., cancer or cancer metastases, in animals or humans. The nucleic acid; stimulates re-vascularisation of ischaemic tissues associated with conditions such as thrombosis, arteriosclerosis, and other cardiovascular conditions; treats wounds due to injuries, burns, post-operative tissue repair, and ulcers; stimulates angiogenesis
                                       printed specification, but was obtained in electronic from the US patent office at ftp.seqdata.uspto.gov/sequence.html?DocID=20020147140.

The present invention describes a library of human polynucleotides comprising the sequences given in AAZ12532 to AAZ1779. Also described is a method of detecting differentially expressed genes correlated with the cancerous state of a mammallan cell, comprising detecting at least one differentially expressed gene product in a test sample from a cell suspected of being cancerous, where the gene product is encoded by one of the 5248 polynucleotide sequences given in AAZ12532 to AAZ1779. The polynucleotides can be used as a source of primers and probes, which can be used for a variety of purpose, e.g. detection of expression levels, mapping, tissue typing or profiling, forensics, genetic analysis and detection of polymorphisms. Polypeptides encoded by the polynucleotides can be used for raising antibodies for experimental, diagnostic and
  Claim
   Novel human genes and their expression products which differentially expressed in different cell types

  therapeutic purposes. The polynucleotides may also be used to construct arrays for diagnostics (which may be used to determine function of an encoded protein); and to detect differences in expression levels between two cells (e.g. to identify abnormal or diseased tissue in a human, to identify a genetic predisposition or susceptibility to a disease such as cancer). The polynucleotides of the invention are especially used in the diagnosis, prognosis and management of colorectal cancer, breast cancer, and lung cancer. The polynucleotides can also be used to screen for peptide analogues and antagonists.
  Human prostate cancer antigen nucleotide sequence SEQ ID NO:220.
AAF15566 to AAF16505 encode the human prostate cancer associated proteins, called prostate cancer antigens, given in AAB56363 to AAB57302.
   Prostate cancer associated gene sequences, referred to cancer antigens, useful for treatment, prevention, and

   corresponding to the overlaping clone, as we submit sequences with only a small overlap as described above.

This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the assembly was confirmed by restriction digest. The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases: Em:, EMBL; Sw:, SWISSPROT; Tr:, TREMBL; Wp:, WORMPEP; Information on the WORMPEP database can be found at http://www.sanger.ac.uk/Projects/C_elegans/wormpep This sequence was generated from part of bacterial clone contigs of human chromosome 9, constructed by the Sanger Centre Chromosome 9 Mapping Group. Further information can be found at http://www.sanger.ac.uk/HGP/Chr9

PD11-34216 is from the library PD71-11 2 Constructed by the arrown
   190
  254
  170
   314 Tregreaagecegeerregaggagriergeergeeg
  Submitted (06-OCT-2001) Sanger Centre, Hinxton, Cambridgeshire, CB10 1SA, UK. B-mail enquiries: humquery@sanger.ac.uk Clone requestes clonerequest@sanger.ac.uk
On Apr 21, 2001 this sequence version replaced gi:13396549.
During sequence assembly data is compared from overlapping clones.
Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission.
  AL358781
Human DNA
  RPII-334J6 is from the library RPCI-11.2 constructed by the group of Pieter de Jong. For further details see http://www.chori.org/bacpac/home.htm
  This sequence is the entire insert of clone RP11-334J6 The true left end of clone RP11-40A7 is at 113870 in this sequence. The right end of clone RP11-643E14 is at 63282 in this sequence.

*Consensus quality: 235589 at least Q40
Estimated insert size: agarose-FP - N/A
**Estimated insert size: 254133 - sum-of-contigs
Quality coverage: agarose-FP - N/A
Quality coverage: 6 x in Q20 bases; sum-of-contigs estimation
  NOTE: This is a 'working draft' sequence. It currently consists of 44 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will
   as soon as it

Example 4; SEQ ID NO 2647; 10078pp; English.

The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, Activin/inhibin activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and

  Controlled the complementary strand of a polynucleotide which comprises one of coligonucleotide sequences defined in the specification, where the coligonucleotide comprises at least 15 nucleotides; or (b) a combination of a noligonucleotide comprises at sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end complementary strand of a polynucleotide which comprises a 5'-end complementary to a polynucleotide which comprises a 5'-end complementary to a complementary to a polynucleotide which comprises at least 15 nucleotides and the combination of coligonucleotide comprises at least 15 nucleotides and the combination of the 5'-end sequence) 3'-end sequence, where the complementary to a polynucleotide from those defined in comprises at least 15 nucleotides and the combination of the specification. The primer sets can be used in antisense therapy and comprises are useful for synthesising polynucleotides, and the comprises of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length cDNAs easily without any specialised methods. AAH03166 to AAH13628 and CAAH3633 to AAH18742 represent human cold sequences; AAAB92446 to CC CDNAs easily without any specialised methods. AAH03166 to AAH13628 and CC controlled to the present human amino acid sequences; AAAB92446 to CC controlled to the present invention.

The patent discloses human uridine kinase-like polypeptides, designated 57658 and polynucleotides encoding such proteins. 57658 DNAs and proteins are useful for developing diagnostic and therapeutic agents for 57658-mediated or related disorders such as haematopoietic neoplastic disorders (e.g. leukaemia), haematopoietic disorders (e.g. psoriasis, dermatitis, diabetes mellitus, rheumatoid arthritis, disorders of bone (e.g. rickets, osteoporosis), heart (e.g. sarcoma, myocardial infarction), blood vessels
  New isolated human uridine kinase treating hematopoietic neoplastic heart and blood vessels

  immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervous system diseases, such as not central nervous system diseases, such as localised neuropathies and central nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, activin/inhibin activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and C.N.S disorders.

  CC polypeptides by recombinant techniques. Also disclosed in the invention CC are methods for utilising uridine kinase polypeptides and polynucleotides in diagnostic assays. The polynucleotides and polypeptides of the convention may be used as diagnostic reagents by detecting mutations in an associated gene. An array of olloponucleotide probes comprising the CC uridine kinase polynucleotide sequence or fragments thereof can be constructed to conduct efficient screening of genetic mutations, for CC example. Detection of abnormally decreased or increased levels of polypeptide or mRNA expression may also be used for diagnosing or CC determining susceptibility of a subject to a disease of the invention. The polypucleotide sequences of the invention can be used for chromosome CC The polynucleotide sequences of the invention can be used as immunogens to produce antibodies. These antibodies may be used as immunogens to produce CC clones expressing the polypeptide. The polypeptides or identify CC clones expressing the polypeptide. The polypeptides and polynucleotides of the invention can be used as a vaccine or in gene therapy to treat CC diseases such as human ovarian cancer, human colon carcinomas, and curidine kinase of the invention.

  polynucleotide sequences (mddt) encoding them. The MDDT polypeptides are used to screen for molecules that bind to, or are bound by the encoded polypeptides, and to develop a transcript image of a tissue or cell type. Probes comprising at least 20 nucleotides of the mddt polynucleotide may be used to assess the toxicity of a test compound. The MDDT polypeptides and mddt polynucleotides are useful in the capression of molecules for disease detection and treatment. Such the expression of molecules for disease detection and treatment. Such clistorders include cell proliferative disorders (e.g. arteriosclerosis, crirhosis, or cancers), and autoimmune/inflammatory disorders (e.g. asthma, Crohn's disease, or multiple sclerosis). The mddt polynucleotides may also be used as molecule markers, in microarrays, and in somatic or germline gene therapy. ABG70306-ABG70341 represent the MDDT proteins of the invention.

The patent discloses human uridine kinase-like polypeptides, designated $7658 and polynucleotides encoding such proteins. 57658 DNAs and proteins are useful for developing diagnostic and therapeutic agents for 57658 mediated or related disorders such as haematopoietic neoplastic disorders (e.g. leukaemia), haematopoietic disorders (e.g. psoriasis, dermatitis, diabetes mellitus, rheumatoid arthritis, disorders of bone (e.g. rickets, osteoporosis), heart (e.g. sarcoma, myocardial infarction), blood vessels (e.g. hypertension, atherosclerosis) and neurons (e.g. Huntington's disease, Alzheimer's disease, Parkinson's disease). 57658 sequences or their antibodies are useful in screening assays, detection assays, forensic biology) and predictive medicine (e.g. diagnostic assays,
   modulate ovarian antigen expression or activity. The polynucleotides may further be used for gene therapy, chromosome mapping, in the identification of individuals and in forensic analysis, and the polypeptides may be used as food additives or to prepare antibodies useful in disease diagnosis, drug targeting and phenotyping. The present sequence represents a human ovarian antigen of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

CATALYTIC ACTIVITY: ATP + uridine = ADP + UMP.

CATALYTIC ACTIVITY: ATP + cytidine = ADP + CMP.

CATALYTIC ACTIVITY: ATP + cytidine = ADP + CMP.

PATHWAY: Pyrimidine salvage pathway.

TISSUE SPECIFICITY: Ubiquitous.

SIMILARITY: BELONGS TO THE URIDINE KINASE FAMILY.
  FUNCTION: Phosphorylates uridine and cytidine to uridine
   monophosphate and cytidine monophosphate. Does not phosphorylate deoxyribonucleosides or purine ribonucleosides. Can use ATP or GT as a phosphate donor. Can also phosphorylate cytidine and uridine

  h. Biochem. Biophys. 336:105-112(1996).

FUNCTION: Phosphorylates uridine and cytidine to uridine monophosphate and cytidine monophosphate. Does not phosphorylate monophosphate. Boes not phosphorylate deoxyribonucleosides or purine ribonucleosides. Can use ATP or GTP as a phosphate donor. Can also phosphorylate cytidine and uridine nucleoside analogs such as 6-azauridine, 5-fluorouridine, 4-thiouridine, 5-fromouridine, N(4)-acetylcytidine, N(4)-benzoylcytidine, 5-fluorocytidine, 2-thiocytidine, 5-methylcytidine, and N(4)-anisoylcytidine, 5-methylcytidine, and N(4)-anisoylcytidine (By similarity). CATALYTIC ACTIVITY: ATP + uridine and + UMP.

CATALYTIC ACTIVITY: ATP + cytidine = ADP + CMP.

PATHWAY: Pyrimidine salvage pathway.
       ween the

  Scoring table:
   Sequence:
   Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

SEQUENCE FROM N.A.
Vu L., Zhao S.Y.; Van Rompay A.R., Norda A., Linden K., Johansson M., "Phosphorylation of uridine and cytidine nucleoside human uridine-cytidine kinases", Mol. Pharmacol. 59:1181-1186 (2001). Submitted (FEB-2002) to the EMBL/GenBank/DDBJ databases. "NEDO human cDNA sequencing project."; Submitted (AUG-2000) to the EMBL/GenBank/DDBJ databases. SEQUENCE FROM N.A. Submitted (APR-2000) "Human uridine kinase SEQUENCE FROM N.A. SEQUENCE FROM N.A., AND CHARACTERIZATION MEDLINE=21203813; PubMed=11306702; Bukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi; Mammalia; Eutheria; Primates; Catarrhini; Hominidae; Homo. "Cloning of Homo sapiens (Human). FUNCTION: Phosphorylates uridine and cytidine to uridine monophosphate and cytidine monophosphate. Does not phosphorylate monophosphate and cytidine monophosphate. Does not phosphorylate deoxyribonucleosides or purine ribonucleosides. Can use ATP or GTI as a phosphate donor. Can also phosphorylate cytidine and uridine nucleoside analogs such as 6-azauridine, 5-fluorouridine, 4-thiouridine, 5-bromouridine, N(4)-acetylcytidine, N(4)-benzoylcytidine, 5-fluorocytidine, 2-thiocytidine, 5-benzoylcytidine, and N(4)-anisoylcytidine.

methylcytidine, and N(4)-anisoylcytidine.

CATALYTIC ACTIVITY: ATP + uridine = ADP + UMP.

CATALYTIC ACTIVITY: ATP + cytidine = ADP + CMP. PATHWAY: Pyrimidine salvage pathway.
TISSUE SPECIFICITY: Ubiquitous.
SIMILARITY: BELONGS TO THE URIDINE KINASE FAMILY. 247 277 *I* a new human ö from prostate cancer cell line (LNCap).";
to the EMBL/GenBank/DDBJ databases. cDNA similar to Mus musculus uridine MW; QR -> HG (IN REF. S -> T (IN PPP AFD9ED92780CD502 GARARAGAN (IN REF. Karlsson A.; analogs by two ATP or GTP kinase 4

  C -!- FUNCTION: Phosphorylates uridine and cytidine to uridine monophosphate and cytidine monophosphate. Does not phosphorylate c deoxyribonucleosides or purine ribonucleosides. Can use ATP or GTP c as a phosphate donor. Can also phosphorylate cytidine and uridine nucleoside analogs such as 6-azauridine, 5-fluorouridine, 4-thiouridine, 5-fluorouridine, N(4)-acetylcytidine, N(4)-anisoylcytidine, and N(4)-anisoylcytidine, 2-thiocytidine, 5-fluorocytidine, 2-thiocytidine, 1-capalyTIC ACTIVITY: ATP + uridine = ADP + UMP.
C -!- CATALYTIC ACTIVITY: ATP + cytidine = ADP + CMP.
C -!- CATALYTIC ACTIVITY: ATP + cytidine = ADP + CMP.
C -!- TISSUE SPECIFICITY: Expressed in placenta.
C -!- SIMILARITY: BELONGS TO THE URIDINE KINASE FAMILY.

Novel nucleic acids and such as central nervous polypeptides, useful system injuries for treating disorders

```
Percent Similarity:
Best Local Similarity:
Query Match:
DB:
  US-09-896-522-1 (1-1624) x AAM41288
   Score:
   the encoded polypeptides (AAM/38642-AAM/42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system disease, such as alzheimer's, parkinson's disease, Huntington's disease, such as alzheimer's, parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Inmune system suppression, activinyinhibin activity, chemotactic/chemokinetic activity, hamostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and C.N.S disorders.

The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM3642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polypucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and

   The present invention describes primer sets for synthesising 5602 (C full-length cDNAs defined in the specification. Where a primer set (C comprises: (a) an oligo-dT primer and an oligonucleotide comprises one of (C the 5602 nucleotide sequences defined in the specification, where the coligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide which comprises at pearly (c complementary strand of a polynucleotide which comprises a 5'-end (c complementary strand of a polynucleotide which comprises a 5'-end (c complementary strand of a polynucleotide which comprises a 5'-end sequence complementary to a (c) polynucleotide which comprises a 3'-end sequence, where the (c) conjugonucleotide comprises at least 15 nucleotides and the combination of (c) the 5'-end sequence) 3'-end sequence is selected from those defined in the specification. The primers sets can be used in antisense therapy and (c) in gene therapy. The primers are useful for synthesising polynucleotides, particularly full-length cDNAs. The primers are also useful for the (c) detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length (c) C cDNAs easily without any specialised methods. AAH03166 to AAH13628 and (c) AAH3633 to AAH13627 represent human amino acid sequences; and AAH31629 to AAH13632 (c) of the present invention.

  The patent discloses human uridine kinase-like polypeptides, designated CC 57658 and polynuclectides encoding such proteins. 57658 DNAs and proteins CC are useful for developing diagnostic and therapeutic agents for 57658—CC mediated or related disorders such as haematopoietic neoplastic disorders CC (e.g. leukaemia), haematopoietic disorders (e.g. psoriasis, dermatitis, Cioteoporosis), heart (e.g. sarcoma, myocardial infarction), blood vessels CC (e.g. hypertension, atherosclerosis) and neurons (e.g. Huntington's CC (e.g. hypertension, atherosclerosis) and neurons (e.g. Huntington's CC (e.g. hypertension) atherosclerosis) and sease). 57658 sequences or CC their antibodies are useful in screening assays, detection assays (e.g. CC forensic biology) and predictive medicine (e.g. diagnostic assays, core of their antibodies are useful in screening and treating 57658 mediated CC They are useful as reagents for diagnosing and treating 57658 mediated CC disorders. 57658 DNAs are useful in gene therapy, in chromosome mapping, CC identify an individual from a minute biological sample (tissue typing) and to aid in forensic identification of the biological sample. The
  New isolated human uridine kinase family polypeptide 57658, useful treating hematopoietic neoplastic disorders and disorders of neuror heart and blood vessels -
   present sequence is human 57658 protein.

polypeptides and polynucleotides and methods for producing such polypeptides by recombinant techniques. Also disclosed in the invention are methods for utilising uridine kinase polypeptides and polynucleotides in diagnostic assays. The polynucleotides and polypeptides of the invention may be used as diagnostic reagents by detecting mutations in an associated gene. An array of oligonucleotide probes comprising the uridine kinase polypucleotide sequence or fragments thereof can be constructed to conduct efficient screening of genetic mutations, for example. Detection of abnormally decreased or increased levels of polypeptide or mRNA expression may also be used for diagnosing or determining susceptibility of a subject to a disease of the invention.

The invention relates to newly identified human uridine kinase

  localisation studies and tissue expression studies. The polypeptides of the invention or fragments thereof may be used as immunogens to produce antibodies. These antibodies may be employed to isolate or identify clones expressing the polypeptide. The polypeptides and polynucleotides of the invention can be used as a vaccine or in gene therapy to treat diseases such as human ovarian cancer, human colon carcinomas, and immunological disorders. This sequence represents the protein of a human variance to the protein of the invention.

  The invention relates to novel genes (ABL89449-ABL90853) and proteins (ABB89040-ABB90444) useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant)agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune disorders e.g. Addison's disease, allergies, autoimmune havoiditis, diabetes mellitus, Crohn's disease, multiple sclerosis, rheumatoid arthritis and ulcerative colitis, (c) cardiovascular disorders such as myocardial ischaemias; (d) wound healing; (e) neurological diseases e.g. cerebral anoxia and epilepsy; and (f) infectious diseases such as viral, bacterial, fungal and parasitic infectious.
   Cytostatic; immunosuppressive; nootropic; neuroprotective; antiviral; antiallergic; hepatotropic; antidiabetic; antiinflammatory; antiulcer; vulnerary; anticonvulsant; antibacterial; antifungal; antiparasitic; cardiant; gene therapy; cancer; immune disorder; cardiovascular disorder; neurological disease; infection; human; secreted protein.
Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format direfrom WIPO at ftp.wipo.int/pub/published_pct_sequences.
  Novel 1405 isolated polypeptides, useful for diagnosis, treatment prevention of neural, immune system, muscular, reproductive,

   molecules for disease detection and treatment (MDDT), and the compound of the sequences (mddt) encoding them. The MDDT polypeptides comay be used to screen for molecules that bind to, or are bound by the coll type. Probes comprising at least 20 nucleotides of the mddt collectide may be used to assess the toxicity of a test compound. The MDDT polypeptides and mddt polynucleotide are useful in the collectide may be used to assess the toxicity of a test compound. The MDDT polypeptides and mddt polynucleotides are useful in the collectides, study, prevention and treatment of diseases associated with the expression of molecules for disease detection and treatment. Such ciscoders include cell proliferative disorders (e.g. arteriosclerosis, crirhosis, or cancers), and autoimmune/inflammatory disorders (e.g. asthma, Crohn's disease, or multiple sclerosis). The mddt collectides may also be used as molecule markers, in microarrays, and in somatic or germline gene therapy. ABG70306-ABG70341 represent to the MDDT proteins of the invention.

  The invention relates to newly identified human uridine kinase (UDK) CC polypeptides and polynucleotides and methods for producing such CC polypeptides by recombinant techniques. Also disclosed in the invention CC are methods for utilising uridine kinase polypeptides and polynucleotides CC in diagnostic assays. The polynucleotides and polypeptides of the CC invention may be used as diagnostic reagents by detecting mutations in an CC associated gene. An array of oligonucleotide probes comprising the CC uridine kinase polynucleotide sequence or fragments thereof can be CC constructed to conduct efficient screening of genetic mutations, for CC example. Detection of abnormally decreased or increased levels of CC polypeptide or mRNA expression may also be used for diagnosing or CC determining susceptibility of a subject to a disease of the invention. CC The polynucleotide sequences of the invention can be used for chromosome CC constructed to conduct thereof may be used as immunogens to produce antibodies. These antibodies may be employed to isolate or identify CC clones expressing the polypeptide. The polypeptides and polynucleotides CC of the invention can be used as a vaccine or in gene therapy to treat CC immunological disorders. This sequencer, human colon carcinomas, and CC a human uridine kinase (UDA) of the invention.
   immunological disorders. This sequence represents the protein relating to a human uridine kinase (UDK) of the invention.

NOTE: The present sequence is stated as being the same as that shown as SEQ ID NO: 2 in the sequence listing of the specification. However, the sequences differ.

The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system diseases, such as alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, activin/inhibin activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and C.N.S disorders.

Sequences AAB73494-AAB73535 represent novel human transferase proteins HTFS-1 to HTFS-42, and sequences AAH33801-AAH23842 represent CDNAs encoding them. The proteins play important roles in the regulation of cellular signalling and proliferation. The HTFS proteins are useful for screening compounds for their effectiveness as agonists or antagonists of transferase activity, or for compounds that specifically bind to an HTFS protein or which modulates the activity of an HTFS protein.

   The invention relates to novel genes (AAL34669-AAL37666) and proteins (ABB03087-ABB04109) associated with the musculoskeletal system useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant)agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer and conter cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune disorders e.g. Addison's disease, allergies, autoimmune haemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's disease, multiple sclerosis, rheumatoid arthritis and ulcerative colitis; (c) caractiovascular disorders such as myocardial ischaemias; (d) wound healing; (e) neurological diseases e.g. cerebral anoxia and epilepsy; and (f) infections diseases such as viral, bacterial, fungal and

This is the amino acid sequence of a novel human musculoskeletal system antigen.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the US patent office at
  The invention describes an isolated nucleic acid molecule comprising a sequence encoding musculoskeletal system associated polypeptides useful for detecting disorders, e.g., cancer or cancer metastases, in animals or humans. The nucleic acid, stimulates re-vascularisation of ischaemic tissues associated with conditions such as thrombosis, arteriosclerosis, and other cardiovascular conditions; treats wounds due to injuries, burns, post-operative tissue repair, and ulcers; stimulates angiogenesis
